Logical operators combine multiple conditions and return a boolean result. 1. 1 2. 2 3.3

Arithmetic Operators

Comparison Operators

Logical Operators

16. 16 17. 17

4.4

| | | 5. 5 1. let hasPermission = true; |
|----------------------|--|--|
| | | let hasPermission = true; let isMember = false; let canAccessResource = hasPermission && isMember; // Logical AND let canViewPage = hasPermission isMember; // Logical OR let isDenied = !hasPermission; // Logical NOT |
| | | Copied! 1. 1 |
| | | 2. 2 3. 3 |
| Assignment Operators | Assignment operators assign values to variables. For example, =, +=, -=. | 1. let $x = 10$; // Assigns the value 10 to the variable x 2. $x += 5$; // Equivalent to $x = x + 5$ 3. $x -= 5$; //Equivalent to $x = x + 5$ |
| | | Copied! |
| | | 2. 2 3. 3 |
| Unary Operators | Unary operators act on a single operand, performing operations like negation or incrementing. | let count = 5; count++; // Increment count by 1 (count is now 6) count; // Decrement count by 1 (count is now 5 again) |
| | | Copied! 1. 1 |
| | | 1. 1 2. 2 3. 3 4. 4 |
| typeof Operator | typeof operator returns the data type of a variable or expression as a string. | let num1 = 42; console.log(typeof(num1)); //the awnswer is Number let name = 'John'; console.log(typeof(name)); //the awnswer is String |
| | | Copied! |
| | | 1. 1 2. 2 3. 3 |
| | | 4. 4 5. 5 6. 6 |
| if Statement | The if statement is used to execute a piece of block code if the given condition is true. | <pre>1. let age = 25; 2. if (age >= 18) { 3. console.log("You are an adult.");</pre> |
| | | <pre>4. } else { 5. console.log("You are a minor."); 6. }</pre> |
| | | Copied! |
| else if Statement | It allows you to test multiple conditions sequentially. If the condition is true then it will execute if statement block otherwise execute else statement block. | 1. 1 2. 2 |
| | | 3. 3 4. 4 5. 5 |
| | | 6. 6 7. 7 |
| | | 8. 8 |
| | | 10. 10 11. 11 12. 12 |
| | | 13. 13 14. 14 |
| | | 15. 15 16. 16 |
| | | 17. 17 18. 18 |
| | | 19. 19 20. 20 |

Nested if else Statement

This statement allows you to test multiple conditions and execute different blocks of code based on the results of those conditions.

                                                                                                                                                   const add = function(a, b) {
Named Function
                                         The functions with a specific name that can be called by that name.
                                                                                                                                           1.
                                                                                                                                           2.
                                                                                                                                                       console.log(a+b);
                                                                                                                                           3.
                                                                                                                                           4.
                                                                                                                                           5.
                                                                                                                                                   //name of the function is add
                                                                                                                                           6.
                                                                                                                                                   add(2, 3);
                                                                                                                                          Copied!
                                                                                                                                           1. 1
                                                                                                                                           2. 2
                                                                                                                                            3. 3
                                         Immediately Invoked Function Expression is a function in JavaScript that's defined and executed
                                                                                                                                            1. (function sayWelcome() {
HFE
                                         immediately after its creation.
                                                                                                                                            2. console.log("Welcome!");
                                                                                                                                            3. })();
                                                                                                                                          Copied!
                                                                                                                                           1. 1
                                                                                                                                           2. 2
                                                                                                                                            1. const arrowFunc = (a, b) \Rightarrow a + b;
Arrow Function
                                         Arrow functions in JavaScript are a concise way to write function expressions, using the => syntax.
                                                                                                                                            2. console.log(arrowFunc(5, 3));
                                                                                                                                          Copied!
                                                                                                                                           1. 1
                                                                                                                                           2. 2
                                                                                                                                            3. 3
                                                                                                                                            4.4
                                                                                                                                            5.5
                                                                                                                                           7. 7
                                                                                                                                           8.8
                                                                                                                                           9. 9
                                                                                                                                           10. 10
                                                                                                                                           11. 11
                                                                                                                                           12. 12
                                                                                                                                           13. 13
                                                                                                                                           14. 14
                                                                                                                                           15. 15
                                                                                                                                          16. 16
                                                                                                                                          17. 17
                                         The return statement in JavaScript is used to end the execution of a function and specify the value that
                                                                                                                                           1. <!DOCTYPE html>
return
                                         the function should return to the caller.
                                                                                                                                           2. <html lang="en">

                                                                                                                                          Copied!
Function Closure
                                         A function closure in JavaScript allows a function to access and remember variables from its outer scope
                                                                                                                                           1. 1
                                         even after that scope has finished executing.
                                                                                                                                           2. 2
                                                                                                                                           3.3
                                                                                                                                           4. 4
```
